RMS COPYRIGHT AND USE OF THIS DOCUMENT

Copyright in this document belongs to Roads and Maritime Services.

When this document forms part of a deed

This document should be read with all the documents forming the Project Deed.

When this document does not form part of a deed

This copy is not a controlled document. Observe the Notice that appears on the first page of the copy controlled by RMS. A full copy of the latest version of the document is available on the RMS Internet website: http://www.rms.nsw.gov.au/business-industry/partners-suppliers/specifications/index.html

BASE SPECIFICATION

This document is based on Specification RMS 3222 Edition 1 Revision 1.
RMS SPECIFICATION D&C 3222

NO FINES CONCRETE (FOR SUBSURFACE DRAINAGE)

1 SCOPE

This Specification sets out the requirements for the supply of no fines concrete for trench, edge and intra-pavement subsurface drainage systems.

2 STRUCTURE OF THE SPECIFICATION

This Specification includes a series of annexures that detail additional requirements.

2.1 (NOT USED)

2.2 SCHEDULES OF HOLD POINTS AND IDENTIFIED RECORDS

The schedules in Annexure 3222/C list the HOLD POINTS that must be observed. Refer to Specification RMS D&C Q6 for the definition of HOLD POINTS.

The records listed in Annexure 3222/C are Identified Records for the purposes of RMS D&C Q6 Annexure Q/E.

2.3 REQUIREMENTS FOR TECHNICAL PROCEDURES

Specific technical procedures for materials and preparation of samples for testing are detailed in Annexure 3222/E.

2.4 FREQUENCY OF TESTING

The minimum frequency of testing is shown in Annexure 3222/L.

2.5 REFERENCED DOCUMENTS

Standards, specifications and test methods are referred to in abbreviated form (e.g. AS 1234). For convenience, the full titles are given in Annexure 3222/M.

3 DEFINITIONS

The term “the Supplier” means the supplier of the product covered by the scope of this Specification.
The following definitions apply to this Specification:

**Batching**
The process of combining the concrete ingredients in fixed proportions by mass or by volume, including charging and mixing.

**Completion of batching**
(a) For a stationary batch mixer discharging into a storage bin, this is the time at which discharge commences from the mixer.
(b) For a stationary batch mixer discharging into a mobile mixer, this is the time at which mixing and slump adjustment ceases at the batching plant, or 10 minutes after the completion of charging of the stationary mixer, whichever occurs first.
(c) For direct charging of a mobile mixer, this is the time at which mixing and slump adjustment ceases at the batching plant, or 10 minutes after the completion of charging, whichever occurs first.
(d) For a continuous mixer discharging into a storage bin, this is the time of earliest discharge (from the mixer) of that concrete within the bin.

**Mixing time**
Applicable to batch mixers only. Comprises only that mixing time carried out at the specified mixing rate (i.e. excluding agitation), measured from the time all the ingredients (including all water) are in the mixing drum until mixing ceases, or after specified revolutions.

**No fines concrete**
No fines concrete is a material containing graded coarse aggregate, generally of a single AS sieve size, bonded together by a paste of cement and water sufficient to provide adequate strength while producing an open-textured cellular concrete with a high volume of voids and high permeability.

**Subsurface drainage**
A means of intercepting and removing subsurface moisture.

### 4 Supplier’s Quality Management System

The Supplier must establish and maintain a Quality Management System complying with AS/NZS ISO 9001 as a means of ensuring that the product conforms to this Specification.

Provide evidence verifying compliance with this Clause.

### 5 Materials

#### 5.1 Coarse Aggregate

**5.1.1 General**

Aggregates for no fines concrete must consist of clean, durable materials. Do not use slag produced during the steel manufacturing process.

Coarse aggregate must conform to AS 2758.1. The properties of the coarse aggregate must also comply with Table 3222.1. If two or more coarse aggregates are to be blended, each coarse aggregate source must comply with the requirements in Table 3222.1.
Table 3222.1 – Coarse Aggregate Properties

<table>
<thead>
<tr>
<th>Property</th>
<th>Requirement</th>
<th>Test Method</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bulk Density (1)</td>
<td>minimum 1,200 kg/m³</td>
<td>AS 1141.4</td>
</tr>
<tr>
<td>Particle Density</td>
<td>minimum 2,100 kg/m³</td>
<td>AS 1141.6</td>
</tr>
<tr>
<td>Water Absorption</td>
<td>maximum 2.5%</td>
<td>AS 1141.6</td>
</tr>
<tr>
<td>Particle Size Distribution</td>
<td>Table 3222.2</td>
<td>AS 1141.11</td>
</tr>
<tr>
<td>Particle shape:</td>
<td>maximum 35%</td>
<td>AS 1141.14</td>
</tr>
<tr>

<tr>
<td>Fractured Faces: two or more (3)</td>
<td>minimum 80%</td>
<td>RMS T239 (4)</td>
</tr>
<tr>
<td>Wet/Dry variation</td>
<td>maximum 35%</td>
<td>RMS T215</td>
</tr>
</tbody>
</table>

Notes:

(1) “Bulk density” in AS 2758.1 means the same as “unit mass” in AS 1141.4.

(2) When tested in accordance with RMS T215, the wet strength must be a minimum of 150 kN and the wet/dry strength variation must not exceed 35%. The fraction to be tested is the particle size distribution interval in Table 1 of AS1141.22 which represents at least 50% of the aggregate by mass.

(3) The area of each fractured face must be a significant proportion of the total surface area of the particle. Testing is required on aggregate derived from gravels and metasediments, including conglomerates. Testing is not required on aggregate derived from igneous rock.

(4) RMS T239 Clauses 6.1, 6.2, 6.3, and 7(b) to 7(d) may be ignored.

5.1.2 Particle Size Distribution

The aggregate particle size distribution in no fines concrete must comply with the requirements of Table 3222.2 when tested in accordance with RMS T201.

Table 3222.2 – No Fines Concrete Particle Size Distribution for Coarse Aggregate

5.1.3 Alkali-Aggregate Reaction

Assess all aggregate for potential alkali-aggregate reaction (AAR) in accordance with Annexure 3222/E within 12 months from the date of closing of tenders.

Do not use aggregates that are classified as having potential for slow/mild or substantial ARR by Test Method RMS T363, or aggregates that are classified as reactive by Test Method RMS T364.
Use alternative aggregates and/or alternative concrete mix designs subject to compliance with the requirements of this Specification.

5.1.4 Soluble Salts

Assess the no fines concrete for soluble salt content in accordance with Annexure 3222/E within 12 months from the date of closing of tenders.

Determine chloride ion and sulphate ion contents by one of the methods in Annexure 3222/E.

The chloride ion and sulphate ion content of the no fines concrete must not be greater than 0.8 kg/m$^3$ of concrete, and 5% of the cement content, respectively.

5.2 CEMENT

Cement must be Type GP cement complying with Specification RMS 3211.

5.3 ADMIXTURES

Chemical admixtures and their use must comply with AS 1478, but must not contain calcium chloride, calcium formate, triethanolamine or any other accelerator.

The following conditions also apply:

(a) For combinations of two or more admixtures, their compatibility must be certified in writing by the manufacturers.

(b) The total alkali contribution (measured as Na$_2$O equivalent) from all admixtures used in any mix must not exceed 0.20 kg/m$^3$.

(c) Detail in the PROJECT QUALITY PLAN the criteria for initiating changes in admixture type with season or ambient temperature. During the warm season, use a lignin or lignin-based ('ligpol') set-retarding admixture (Type Re or WRRe). If a retarder is used during the cool season, it must be a lignin Type WRRe containing not more than 6% reducing sugars.

(d) Superplasticisers and high range water reducers Type HWRRe may be used.

5.4 WATER

Water used in the production of no fines concrete must be free from materials which are detrimental to the no fines concrete, and must neither be salty nor brackish. The water must conform to AS 1379, in particular Clause 2.4 and Table 2.2 – Limits for Impurities in Mixing Water, and the following:

(a) chloride ion: maximum 500 parts per million of chloride ion, determined in accordance with Test Method RMS T1004;

(b) sulphate ion: maximum 400 parts per million of sulphate ion, determined in accordance with Test Method RMS T1014.
6 DESIGN REQUIREMENTS

6.1 NOMINATED MIX

The aggregate to cement ratio must be in accordance with Table 3222.3.

<table>
<thead>
<tr>
<th>Grade</th>
<th>Aggregate to Cement Ratio (by mass)</th>
<th>Water to Cement Ratio (by mass)</th>
</tr>
</thead>
<tbody>
<tr>
<td>NFC SD</td>
<td>6:1</td>
<td>0.35 – 0.45</td>
</tr>
</tbody>
</table>

The water to cement ratio must provide for complete cementitious paste coverage of the aggregate. The water and paste content must not be such as to cause the paste to flow during mixing, handling or placing.

Before commencing production of the no fines concrete mix:

(a) conduct trial mixes to demonstrate that the proposed mix designs comply with this Specification;
(b) certify that each nominated mix and its constituents meet the requirements of this Specification;
(c) submit NATA endorsed test results for all relevant tests;
(d) submit a copy of a verification checklist covering the items listed below.

Submit the following details for each nominated mix:

(i) Cement – in accordance with Specification RMS D&C 3211;
(ii) Nominated cement content expressed in kg/m³ and as a percentage of the dry mass being bound;
(iii) Water – source;
(iv) Admixture(s) – proprietary source, type, name, dosage recommended by manufacturer;
(v) Aggregates – source, geological type, moisture condition on which the mix design is based (oven dry, saturated surface dry or nominated moisture content);
(vi) Mix Design – constituent quantities per yielded cubic metre of no fines concrete, water to cement ratio, nominated particle size distribution of aggregates in accordance with AS 1141.11, and properties as listed in Table 3222.2;
(vii) Permeability.

The date of testing of both the nominated mix and the aggregates must not be older than eighteen months from the time the nominated mix is proposed to be used. If sufficient production mix test results are available from within this period, the RMS Representative may reduce the scope of the trial nominated mix.

Submit a new nominated mix if any changes occur to the source or proportions of materials or methods of production.
**HOLD POINT**

Process Held: Delivery of no fines concrete.

Submission Details: At least five working days before proposed date of delivery, submit the following:

(i) All test results and certificates together with a statement that the Nominated Mix complies with all the requirements of this Specification.

(ii) Details of the mixing plant and delivery vehicles in accordance with Clause 7.2.

Release of Hold Point: The Nominated Authority will consider the submitted documents prior to authorising the release of the Hold Point.

**6.2 PERMEABILITY**

Mould and cure the specimens in accordance with Test Method RMS T376.

Test the permeability in accordance with Test Method RMS T377.

**7 PROCESS CONTROL**

**7.1 PRODUCTION MIXES**

The production mix must always target the nominated mix.

Table 3222.4 shows the allowable tolerances on coarse aggregate and binder content for the production mix.

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Tolerance (% by mass)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Particle Size Distribution (AS sieve):</td>
<td></td>
</tr>
<tr>
<td>19.00 mm</td>
<td>± 2</td>
</tr>
<tr>
<td>9.50 mm</td>
<td>± 5</td>
</tr>
<tr>
<td>Binder content</td>
<td>+ 3.0 / - 0</td>
</tr>
</tbody>
</table>

Production of the mix must be such that the minimum proportion of cement incorporated is not less than that required to achieve the specified ratio of aggregate to cement.

At the end of each day’s production, total up the individual masses of cement and aggregate used in the day’s production of the no fines concrete, and provide these details to the RMS Representative.
7.2 **MIXING AND CONSISTENCE**

7.2.1 **General**

Do not use aggregates which have become intermixed or contaminated with foreign matter.

Weigh the cement separately.

Use a measuring device calibrated in one litre increments for volumetric batching of water.

Liquid metering equipment for admixtures must measure the volume, or mass, of liquid to an accuracy of ± 5 percent of the value shown on the indicating device except that, for water metering equipment, the accuracy must be ± 2%.

7.2.2 **Handling, Storing and Batching**

Detail in the PROJECT QUALITY PLAN the proposed methods of handling, storing and batching materials, and the method of charging the mixer, including the proposed sequence of addition of ingredients. The method of charging must be consistent with the recommendations of the suppliers of mix additives.

After the completion of batching in the case of batch mixers, discharge the entire batch of no fines concrete from the mixer before any further charging takes place, with the exception of conforming retempering.

The handling, storing and batching of materials and the mixing, transport and consistence of no fines concrete, including any retempering, must comply with AS 1379 (Section 4 and Appendix A) and the following conditions:

(a) For stationary batch mixers, the mixing time must not be less than 54 seconds plus 6 seconds for each cubic metre (or part thereof).
   For mobile batch mixers, provide the full period of mixing required for that mixer at either the testing station or the point of placement. Ignore all other mixing and agitation for the purpose of assessing the actual mixing time for a specific batch.

(b) The maximum mixing time is five minutes for split drum mixers, or 10 minutes otherwise.

(c) Admixtures must be separately and thoroughly prediluted in the mixing water before their introduction to other materials. They must then be mixed in accordance with the manufacturer’s instructions, and by a method that ensures that no adverse reaction occurs. Detail in the PROJECT QUALITY PLAN how admixtures will be incorporated to comply with this requirement.

(d) Each batch or load of no fines concrete must be accompanied by an identification certificate (delivery docket) which is pre-numbered and which must be issued sequentially in accordance with the order of batching. The certificate must record the time of completion of batching. Subsequent addition of water (retempering) in accordance with Clause 7.2.3 is deemed to have taken place after completion of batching.

Mixing time is measured from the time all ingredients, including all water, are in the mixing drum.
7.2.3 Retempering

Detail in the PROJECT QUALITY PLAN how the supply of no fines concrete will be monitored for compliance with the following retempering provisions.

No fines concrete which is delivered by mobile batch mixer may be retempered in accordance with the following conditions:

(a) Immediately after retempering with water, the mixing mechanism must be operated at the designated mixing speed for not less than 30 revolutions or for such additional time as may be necessary to re-establish uniformity of the mix, except that if assurance is not available regarding the original mixing conditions, the retempered batch must be re-mixed for 55 revolutions.

(b) The quantity of water added must be recorded on the identification certificate for that batch and must not exceed the mix design water to cement ratio. If water is added after the commencement of discharge, the estimated remaining quantity of no fines concrete at that time must also be recorded.

(c) Retempering is permitted only within 40 minutes of the completion of batching.

(d) Retempering must only take place in the presence of your representative previously nominated to the RMS Representative for this purpose and only at either the batch plant, the testing station, or the point of placement.

7.3 TRANSPORT OF NO FINES CONCRETE

Transport the no fines concrete from the source of supply to the work in mobile batch mixer vehicles constructed so that loss of material does not occur. Delivery vehicles must be suitable for conditions at the delivery site.

At the time of delivery, the no fines concrete must be thoroughly mixed and must not be segregated or contaminated. Material delivered to the work site which is segregated or contaminated is nonconforming.

7.4 SAMPLING

Sample the no fines concrete in accordance with the requirements of this Specification.

Sample the no fines concrete at the point of delivery within 45 minutes of the completion of batching.

8 CONFORMITY

8.1 PERMEABILITY

All permeability results must exceed 20 mm/s.
8.2 **AGGREGATE TO CEMENT RATIO**

The aggregate to cement ratio must not exceed that specified in Table 3222.3 measured and reported daily.

8.3 **NONCONFORMING MATERIAL**

Nonconforming material must be removed from the Site and replaced by material that conforms to this Specification. Notify the RMS Representative of any such nonconforming material and of the action taken to deal with the nonconformity.
ANNEXURES 3222/A AND 3222/B – (NOT USED)

ANNEXURE 3222/C – SCHEDULES OF HOLD POINTS AND IDENTIFIED RECORDS

ANNEXURE 3222/D – (NOT USED)

ANNEXURE 3222/E – REQUIREMENTS FOR TECHNICAL PROCEDURES

This Annexure details supplementary requirements for the supply of no fines concrete.

The clause numbers in this Annexure after the prefix “E” correspond with the relevant clause number in this Specification. There are gaps in the clause numbers.

E3 MATERIALS

E3.1 Coarse Aggregate

Alkali-Aggregate Reaction (AAR)

Use both of the following methods to carry out an assessment for AAR:

(a) petrographic examination and;
(b) assessment and classification for AAR using the accelerated mortar bar test RMS T363 or the concrete prism test RMS T364.

This testing may be carried out by a laboratory which is not NATA registered for this test.

Petrographic examination must be in accordance with ASTM C295. Those aggregates containing obviously reactive components (such as the following) may be eliminated without further testing:

(i) opaline material;
(ii) unstable silica minerals such as moderate amounts of tridymite and cristobalite; or
(iii) sheared rock containing moderate amounts of strained quartz and microcrystalline quartz.

Soluble Salts

The two methods for testing chloride and sulphate ion contents are as follows. Testing by only one method is required.

(a) Test Method for Constituent Materials

(i) Conduct chloride testing in accordance with:
   - AS 1012 Part 20 for aggregates;
   - AS 1478 Appendix D for water and admixtures dissolved in water;
   then calculate the total content and percentage.

(ii) Conduct sulphate testing in accordance with:
   - AS 1012 Part 20 for aggregates;
   - AS 1289.4.1.2 for water and admixtures dissolved in water;
   - AS 2350.2 for cementitious materials;
then calculate the total content and percentage.

(iii) Notes:

(A) For admixtures, the soluble salt contents may be taken as the values certified in writing by the manufacturer.

(B) For water, the source proposed for the Works must be tested.

(b) Test Method for Hardened Concrete

Conduct chloride and sulphate testing in accordance with AS 1012 Part 20. The water used in the concrete must be from the source proposed for the Works.
### Annexure 3222/L – Testing Requirements

#### L1 Minimum Frequency of Testing

<table>
<thead>
<tr>
<th>Clause</th>
<th>Characteristic Analysed</th>
<th>Test Method</th>
<th>Minimum Frequency of Testing</th>
</tr>
</thead>
<tbody>

</tr>
</tbody>
</table>

**Notes:**

(1) Provided that all of the six previous tests have met the Specification requirements for both wet strength and wet/dry strength variation, the following reduced frequency may apply;
   - (a) where all wet/dry variation results are less than 25 percent: 1 per 10,000 tonnes
   - (b) where all wet/dry variation results are less than 30 percent: 1 per 4,000 tonnes

(2) Within previous 12 months before the date of closing of tenders, or else in conjunction with the trial mix.
