Test method T112

Dry density/moisture relationship of road construction materials (Modified compaction)

1. Scope
This test method sets out the procedure to determine the relationship between moisture content and dry density of road construction materials.

The method uses modified compaction on independent sub-samples having different moisture contents.

NOTE: The method is adapted from AS 1289.5.2.1.

2. General
(a) Modified compaction shall be used.
(b) The test method is applicable to material passing the AS 37.5 mm sieve. However, if the Optimum Moisture Content (OMC) and the Maximum Dry Density (MDD) are to be used only for Unconfined Compressive Strength or California Bearing Ratio determinations, only the portion passing the 19 mm AS sieve is tested.
(c) For material stabilised in the field, time limits may be imposed in specifications for sampling and testing.
(d) This test method is not applicable for material stabilised in the laboratory (refer to T130 or T150).

3. Apparatus, Preparation, Procedure, Calculations and Reporting
(a) This test method is identical to -T111 except that modified compaction is specified.
(b) Include reference to this test method in the report.
